```
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                                                                                                                                                                                                                                                      toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rat IGF-I isoform MGF: MGF is a muscle isoform having extracellular (Ec) domain, hence also referred as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rabbit; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclenosis; spinal muscular atrophy; muscular atrophy; poliomyelltis; post-polio syndrome; toxin; motoneurone disorder; poliomyelltis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                    Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             isoform having extracellular (Ec) domain, hence also referred as IGF-I-Ec. The MGF protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                  The present invention relates to use of mechano-growth factor (MGF),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 GPETLCGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 GPETLCGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 111;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 CVRCKPTKSARSIRAQRHTDMPKTQKSQPLSTHKKRKLQRRRKGSTLEEHK 111

```
The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polymorlectide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, poliomyelitis or post-pollo syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                    Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rabbit IGF-I isoform MGF. MGF is muscle isoform having extracellular (Ec) domain, hence also referred as IGF-I.Ec. The MGF protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

                                                                                                                A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophies and related progressive skeleral muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents rabbit IGF-1 used in the present specification.

The present five flowth Factors (1 decream) 91.00. Incomplete of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avoision, and effects motoneurone secue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the rescue. The MGF polynucleotide and polypeptide are useful in the amunicature of a medicament for the treatment of a neurological disorder, including a disorder of medicament for the treatment of a neurological disorder, including a disorder of metoneurones and/or neurological disorder, or 9; amyotrophic lateral sclerosis, spinal muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with ading, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, ceripheral neuropathies, Alzhaimer's disease and Parkinson's disease. The present sequence is human IGF-I isoform MGF MGF is a muscle isoform having extracellular (EC) domain, hence also referred as incleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1;

The present invention relates to use of mechano-growth factor (MGF),
an Insular-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable
of reducing motoneurone loss by 20% or greater in response to nerve
avulsion, and effects motoneurone rescue, preferably adult motoneurone
rescue. The MGF polynucleotide and polypeptide are useful in the
manufacture of amedicament for the treatment of a neurological disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive
spinal muscular atrophy, infantile or juvenile muscular atrophy,
poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an
injury that affects motoneurones, motoneurone loss associated with aging,
autosomal or sex-linked muscular dystrophy, diabetic neuropathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rat; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motomeurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease; liver; L.IGF-I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The present sequence (SEQ ID NO: 12) is stated as being the same as that shown in figure 9 (AAE02531) of the specification. However
                                                                                                    Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rat liver-type IGF-I isoform (L.IGF-I). The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 GPETLCGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 60

```
The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvanile muscular atrophy, poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging,
                                                                                                                                                                                                                                                                                                                                                                                                                of reducing motoneurone loss by 20% or greater in response to nerve vaulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynuclectide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies. Alzheimer's disease and Parkinson's disease. The present sequence is alternative version of rat liver-type IGF-I isoform (L.IGF-I). The L.IGF-I protein comprises amino acid sequences of IGF-I exons 4 and 6.

Note: The present sequence is stated as being the same as SEO ID NO: 12 shown in sequence listing (AAE02451) of the specification. However
                                                                                                                                                                                                                                                 Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 GPETICGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 60

The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF Polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, eg., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or invenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is human liver-type IGF-I isoform (L.IGF-I). The LIGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.
                                                                                                                                                                   Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 GPETLCGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; long-term memory protein; LTM; insulin-like growth factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neuroleptic; anticonvulsant; nootropic; neuroprotective; IGF1; cerebroprotective; drug discovery; therapeutic profiling; learning disability; memory impairment; brain injury; epilepsy; mental retardation; senile dementia; Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                    A 42 base oligonucleotide corresponding to the DNA sequence encoding amino acids 10 to 23 of mature human IGF-I was synthesized (AAN70437). The radiolabeled 42 mer was then employed to screen for IGF-I containing DNA sequences in a human liver cDNA library. Insulin-like growth factors-IA and -IB CDNAS were isolated from a human CDNA library by using lambdagt 11 (AAN70435, AAN70436). The human IGF-I genomic gene was isolated and mapped. It encodes at least two preproinsulin-like growth factor-I proteins. An essentially pure proproinsulin-like growth factor-I protein comprissing the sequence of amino acids shown in Figure six is claimed (AAP70277).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

animal comprises treating with an agent that modulates the activity of animal comprises treating with an agent that modulates the activity of one or more of genes from zif268, insulin-like growth factor (IGF).

Comportses treating with an agent that modulates the activity of and neuroendocrine VGF (neurotropin-inducible gene). The method is useful for conducting a drug and/or target discovery business, which comprises conducting a drug and/or target discovery business, which comprises conducting therapeutic profiling of the agents (or their analogues) identified, for efficacy and toxicity in animals, and analogues) identified as having an acceptable therapeutic profile and/or licensing to a third party the rights for further drug development of the identified agents. The method of conducting drug discovery business inturher comprises an additional step of establishing a distribution of system for distributing the preparation for sale and may optionally include establishing a sales group for marketing the preparation. A pharmaceutical composition containing the agent is useful for enhancing memory consolidation in an animal, or for augmenting agent (agonist) or otherwise for enhancing the functional performance of central nervous system neurons, where the agent is a cAMP elevating agent (agonist) preferably a cAMP analogue or CAMP phosphodiesterase inhibitor, which activates adenylate cyclase. The composition is useful for treating diseases associated with learning disabilities, memory impairment e.g. due to toxicant exposure, brain injury, epilepsy, mental retardation in children and semile dementia, including Allahen's disease. The contraction in sulfile relation in sulfile of the preparation in sulfile of the preparation in sulfile and semile dementia, including Allahen's disease. The contraction in children and semile dementia, including Allahen's disease. The

```
The amino acid sequence of the insulin-like growth factor I pre-protein. Processing of the protein results in a 70 amino acid mature protein. The mature protein is split into 4 domains: the B domain has strong homology to the B chain of insulin, the A domain similarly has homology to the B chain of insulin, the A domain similarly has homology to the A chain of insulin. These domains are separated by a C domain and the mature protein is terminated by a D domain at the C-terminus. The D domain sequence was used to synthesis peptides (AAR83801-2) that include amino acid residues 60-64 of the mature IGF-1 protein. IGF-1 binds to the IGF-I receptor (IGF-IR) via the D domain and induces activated IGF-IR by autophosphorylation of the IGF-IR.

Activated IGF-IR is associated with callular growth and proliferation. The synthetic peptides are useful as inhibitors of IGF-I binding to IGF-IR and thus may be used in the treatment of disorders characterised by undesirable cell proliferation eg. cancer, restenosis, asthma, burns,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

DNA can be used in the vector of the invention, for expression of a nucleic acid sequence in a cell, which comprises: (a) a nucleic acid cassette containing a sequence encoding IGF-I; (b) a 5' flanking region including one or more sequences necessary for expression of the nucleic acid cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the linker having a position for inserting the nucleic acid cassette, and lacking the coding sequence of a gene with which it is naturally associated; and (d) a 3' flanking region, including a 3' untranslated region or a 3' non coding region or both, where the 3' flanking region is 3' to the position for inserting the nucleic acid cassette and comprises a sequence from a growth hormone 3' urg. The vector can provide for efficient IGF-I expression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muscle atrophy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diabetes, neuropathy, osteoporosis, and growth disorders. They can be used for treating peripheral neuropathies resulting from diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Chacot-marie-tooth disease, AIDS, atherogenesis, atherosclerotic, acatiolovascular, or peripheral vascular disease, haemophilia, inflammation and side-effects from anti-cancer and antiviral drugs. The vectors can also be used to create transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method has been developed of treating urinary incontinence (UI) in mammals. The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents human IGF-1 (insulin-like growth factor 1) which is used in the method of the invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system can improve UI by enhancing both their integrity and

The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rabbit; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; poliomyelitis; post-polio syndrome; dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease; liver; L.IGF-I.
A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in againg humans, spinal cord injury induced muscle atrophy and neuromuscular diseases,
                                                                                                                                                     and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents human IGF-I Ea isoform used in the present specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1. The IGF-1 precursor is prepared by inserting the coding sequence into an expression vector, transforming a host cell with the expression vector. culturing the transformed cell and retrieving the IGF-1 precursor from the culture supernatant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of insulin like growth factor I characterised by presence of Ecpeptide – to treat humans or animals, particularly muscle disorders, heart conditions or neuromuscular diseases

avulsion, and effects motoneurone rescue, preferably adult motoneurone conversion, and effects motoneurone rescue, preferably adult motoneurone construction, and effects motoneurone rescue, preferably adult motoneurone conversions and/or neurological disorder, amoufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive convince, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, contropathy, also and parkinson's disease.

Controlled acid sequence is rabbit liver-type IGF-I isoform (L.IGF-I).

The LIGF-I protein comprises amino acid sequences encoded by conclete acid sequence of IGF-I exons 4 and 6.

Note: The present sequence (SEQ ID NO: 14) is stated as being the same as that shown in figure 10 (AAE02456) of the specification. However it differs at few positions.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A; Molecule type: protein
A; Residues: 49-53, X',55-65, X',67-75 <KAR>
A; Experimental source: platelet lysake, M.; Sara, V.R.
Stordquist Sandberg, A.C.; Stahlbom, P.A.; Lake, M.; Sara, V.R.
Submitted to the EMBL Data Library, November 1990
A; Rescription: Nucleotide sequence of the human fetal brain IGF-la.
A; Reference number: $30519
A; Accession: $30519
A; Status: preliminary

"Location of disulphide bonds in human insulin-like growth factors of disulphide bonds in human insulin-like growth factors spiomed. Environ. Mass Spectrom. 16:3-8(1988).
-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASWA, ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A MICH HIGHER GROWTH-PROMOTING ACTIVITY.
-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sato A., Nishimura S., Ohkubo T., Kyogoku Y., Koyama S., Kobayashi Yasuda T., Kobayashi Y.;

BIOL. Chem. 204:5616-5621(1989).

-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA, ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: 2 ISOFORMS; ISOFORM IGF-IA (SHOWN HERE) AND ISOFORM IGF-IB (AC POBO34); ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.

                                           Raschdorf F., Dahinden R., Meerki W., Richter W.J., Merryweather J.P.;
"Location of disulphide bonds in human insulin-like growth factors
"Location of disulphide bonds in human insulin-like growth factors
(IGFs) synthesized by recombinant DNA technology.";
Biomed. Environ. Mass Spectrom. 16:3-8 (1988).
-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH PROWOTING ACTIVITY.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE
PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   INSULIN-LIKE GROWTH FACTOR IA.

                                                                                                                                                 "Insulin-like growth factor-I messenger RNA content in the oviduct of Japanese quail (Coturnix coturnix japonica): changes during growth and development or after estrogen administration."; comp. Biochem. Physiol. 109C:191-204(1994).

-! FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA, ARE STRUCTURALLY AND FUNCTIONALIX RELATED TO INSULIN BUT HAVE A MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-! SUBCELLULAR LOCATION: Secreted.
-! SUBCELLULAR ELONATION SECRETED.
Coturnix coturnix japonica (Japanese quail).
